Plant Oil (Hexa-Hydroxyl)

By DoMyOwn staff

OVERVIEW

How is Plant Oil (Hexa-Hydroxyl) Used For Pest Control?

Plant Oil (Hexa-Hydroxyl) is a revolutionary organic insecticide trademarked by EcoSMART brand pest control products. EcoSMART developed the natural active ingredient Plant Oil (Hexa-Hydroxyl) after years of research and testing. The aim was to produce an active ingredient with both botanical and insecticidal properties that would would kill pests quickly, yet at the same time be unbelievably safe for use in the home and around children and pets.

What sets EcoSMART products apart from other organic insecticide products?

While other organic pesticides utilize the naturally occurring insecticidal properties of a single botanical tree oil, EcoSMART researchers were among the first to discover that the properties of such oils could actually be enhanced by blending several oils together to form one powerhouse ingredient. EcoSMART's revolutionary active ingredient is so unique that it has gained the attention and endorsement of entomologists all over the world.

How does Plant Oil work to kill insects?

Plant Oil (Hexa-Hydroxyl) works by blocking neural pathways and attacking transmitters that regulate heart rte, movement, behavior, and metabolism-leading to death. Because the affected neural pathways do not exist in mammals, the plant oil ingredient does not pose a threat to people or pets, only insects.
