PATENT PENDING

A NEW INNOVATIVE WAY TO CATCH SNAKES. SAFE AND REUSABLE.

It works 24 hours a day, 365 days a year. This trap can be used almost any place. In and around homes, lake homes, boat houses, hunting lodges, vacation homes, barns, garages, basements, decks, pools, flower beds, gardens, and around fish ponds. Almost any place snakes have been seen.

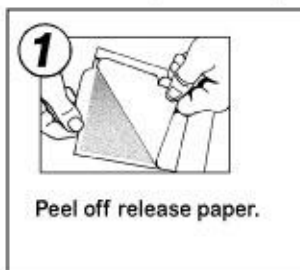

This trap will catch rodents, lizards, and insects. It is very good at catching Brown Recluse Spiders. The Cahaba Snake Trap is a great way to protect a vacation home you do not visit very often. Remember the trap works 24 hours a day 365 days a year. The inserts are active for 12 months. Stored inserts are good for five years.

INSTRUCTIONS:

Read carefully before attempting to use this product. Protect yourself and others by observing safety information.

Dispose of any catch in a safe and humane manner. Be very careful with poisonous snakes. Keep any catch away from children and pets. Place catch in trash bag and into garbage container or refer to 'Humane Release' below.

This trap is made to help control unwanted snakes. It also helps control rodents, insects and brown recluse spiders. This product can be used most any place; in homes, lake homes, hunting lodges, vacation homes, travel trailers, boat houses, and any place needed. Good for camping also.

1 Peel off release paper.

a. Slide glue board inside the Cahaba container.

b. Position glue insert in middle of Cahaba container, leaving 7" on each end.

3 Place trap where snakes have been sighted along walls in the house, basements, and drop ceilings; Outside in flower beds, carpools, & any place where snakes are seen.

Humane Release: The use of mineral or vegetable oil may be used to free animals from glue boards. Use caution when releasing animals and always wear protection to guard against bites, scratches or attacks from animals.

Additional Information & Tips:

- One Glue Pad can work for 12 months. Pads stored properly will last for 5 years.
- WD40 Spray Lubricant is very good for a quick release if a child or pet gets in to a glue pad.
- Using trap outside, place in a shaded area or cover with leaves or straw.
- For spiders, place under furniture, beds and in closets.

Frequently Asked Questions:

How are snakes attracted to the Cahaba Snake Trap?

First you must place the trap in the correct location. In the wild, snakes seek cover for their protection and a place to hide. Cahaba Snake Trap gives the appearance of both a place to hide and protection. The snake crawls in for his safety and is caught in the insert.

How can I tell the difference between poisonous and non-poisonous snakes?

There are only 4 species of poisonous snakes in North America; Cooperhead, Rattlesnake, Cottonmouth Water Moccasin, and Coral Snake. Learn to identify these snakes from photos and you can safely assume all other snakes you see in North America are non-poisonous.

What are Pit Vipers?

Pit Vipers have a small heat sensor or pit on each side of the head between the eye and nostril. This pit is used to locate warm-blooded prey. It acts like an infrared heat detector. However, the pit doesn't accurately tell the size of the prey. Unfortunately, snakes don't see well at night, and as a result we could be mistaken for prey at night. Three of four North American poisonous snake species are pit vipers: Cottonmouth, Rattlesnake, and Copperhead.

What should I do if I'm bitten by a poisonous snake?

Most methods of self treatment are now deemed to cause more harm than good. The best thing to do is remain calm and seek professional medical care as soon as possible.

How dangerous are bites from a poisonous snake?

Small children are in more danger than adults because the venom is more concentrated in their small body mass. It also depends on how much venom is received. Everyone who is injected with venom should receive medical treatment. It is estimated that 10-16 people die each year from snake bites in North America.

If I am bitten by a poisonous snake, should I kill it and take it to the hospital for identification?

No, once you get to the hospital a simple blood test can determine what kind of venom is in your system. Emergency room staffs rightfully take a dim view of bringing snakes (alive or dead) into the emergency room.

Do rattlesnakes always rattle to warn us?

They usually do, but not always. They rattle because they are frightened and they think they will be seen. If they are secure in their camouflage, they probably won't rattle.

Can snakes hear?

No, regardless what you may have heard about making noises to warn snakes of approach or presence, they are completely deaf and live in a silent world. However they can pickup small, minute ground vibrations of other creatures (including us) moving in their immediate area. It's one way they avoid danger and enemies. They also use this ability to locate prey.

Thanks for purchasing Cahaba Snake Trap!
