

Mattress & Foundation Encasements

Standard Service Protocol

1

Inspect the top surface of the mattress and carefully remove any visible bed bug “evidence” (adults, nymphs or eggs) from the mattress using a vacuum. This step protects the technician while installing the encasement.

2

Stand mattress up against wall with the vacuumed side against the wall.

Use two people if the mattress is larger than a Twin.

Only your hands should contact the mattress as you are moving it.

Keep your body out from under the mattress so that any bed bugs that might drop off of the mattress fall on the floor and not on you.

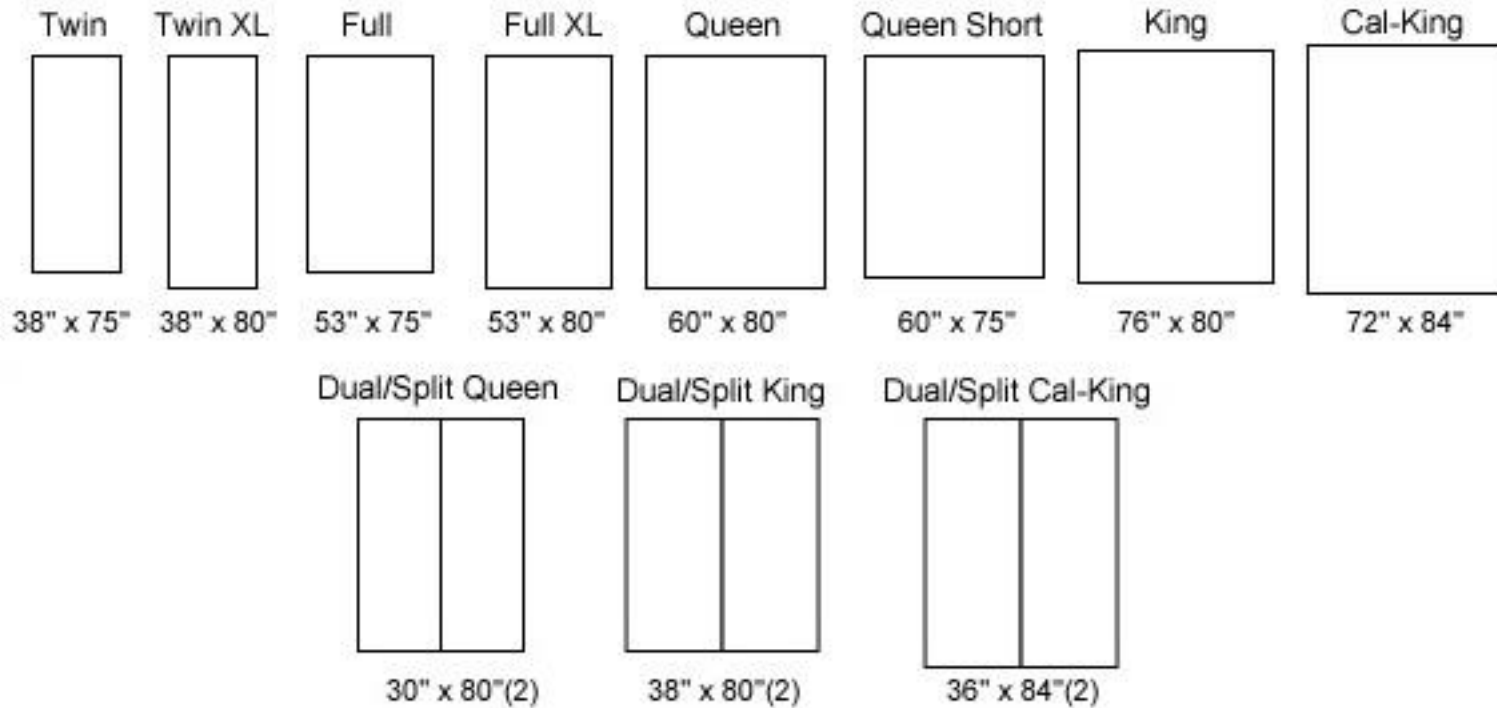

3

Vacuum any bed bugs and/or eggs on bottom surface of mattress.

4

You should measure the length, width and depth of the mattress in inches.

5

Determine the most appropriate size of the encasement.
Not all mattresses will fit an encasement perfectly.

6

Unzip the encasement

7

Drape the encasement over the mattress
with the closed end of the encasement
at the top of the mattress.

8

Zip the encasement **COMPLETELY CLOSED** to make sure that bed bugs cannot escape the encasement. Use the zip tie provided in the encasement packaging to seal the encasement closed. If the zip tie is “cut” on any follow-up services please inform management that the encasement has been tampered with.
