

Q: What if I accidentally filled the Spartan Mosquito Eradicator with cold water?

A: The unit will still work, but will not work optimally until the water temperature reaches 80 degrees or more. After the unit reaches 80 degrees or more one time, the unit will work optimally, even after the temperature has cooled.

Q: What if I have to hang the unit in the sun?

A: The Spartan Mosquito Eradicator will still work. However, the water in the unit may evaporate more quickly.

Q: What if I still see mosquitos?

A: Check the date the units were hung. The units last 90 days. Also, be sure there are at least two units per acre. The mosquito population will diminish by 95% in 15 days or less of placement after they have been activated with warm water.

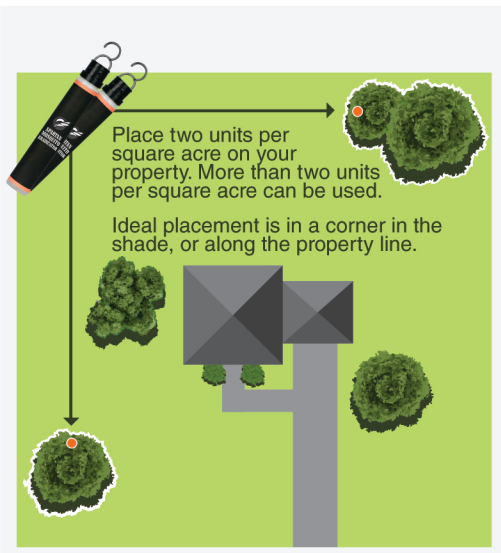

- Ensure the water level remains above the WATER LEVEL LOW line for optimal performance.
- Mosquito population will diminish by 95% in 15 days or less.
- Replace Spartan Mosquito Eradicators every 90 days.

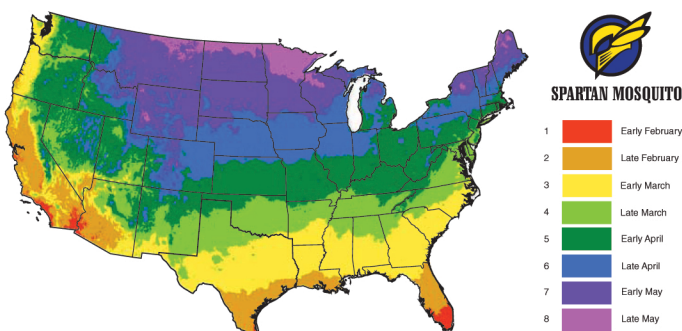

INSTRUCTIONS:

READ THIS BEFORE INSTALLATION

- Remove Spartan Mosquito Eradicator tubes from the box and attach hooks to the black caps for hanging purposes.
- For each unit, remove the temporary cap and **fill with WARM water** to the fill line indicated on the back of the tube.
- Secure black caps (with hooks attached) to the top of the Spartan Mosquito Eradicator tubes.
- Hang Spartan Mosquito Eradicators along the perimeter / property line of the area to be protected, no more than 180 feet apart. If the property is less than one square acre, hang the units on opposite corners of the property.
- Be sure to hang the units away from areas where people gather, since mosquitoes will gather near the Spartan Mosquito Eradicators to feed.

- The ideal height to hang the Spartan Mosquito Eradicator is about six feet above the ground.
- Spartan Mosquito Eradicators can be hung from trees, large shrubs, fences, posts, or other structures. Hang Spartan Mosquito Eradicators in shade if possible to reduce evaporation of water in the units.
- Ideal deployment time for the Spartan Mosquito Eradicator is based on weather, but a good rule of thumb is to deploy them after the “first bite” of the mosquito season.

Deployment Times based on Average Annual Minimum Temperatures
