

PHOSGARD® PLUS

Slow-Release Phosphorus with Extraordinary Mineral Compatibility

Phosgard Plus contains both phosphate and phosphite for an immediate and long-lasting phosphorus supply. Phosphate is readily available to plants upon application, while phosphite converts over time to an available form providing a continuous phosphorus supply for optimum growth.

Phosphorus is an essential element in agriculture with many functions. This includes photosynthesis, respiration, protein and nucleic acid synthesis, and nutrient transport through plant cells. While important to growth, the phosphorus in soils is often not enough to meet the needs of growing plants.

By supplying both immediate and slow release forms of phosphorus, **Phosgard Plus** can supply the necessary amounts of phosphorus to plants for long-lasting nutrition.

Product Profile

Form: Liquid

Function: Two forms of phosphorus to provide a continuous supply to growing plants

Compatibility: Compatible with all crop types

Shelf Life: Cool, shaded areas, up to 3 years

**Made in
USA**

Advantages:

- Boosts vigor and growth
- Can help increase root growth
- Absorbed by roots and leaves

Key Features

- Immediately available phosphate
- Slow release phosphorus
- Increased micro nutrient availability
- A complete phosphorus source

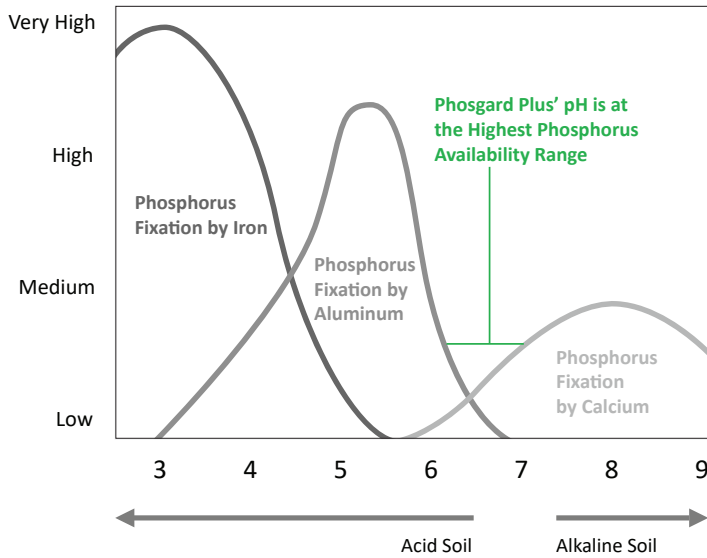

Recommended Use

Phosgard Plus can be applied as a soil drench, a foliar spray, and trunk treatment, and as a plant or root dip.

Amount of Phosphorus Fixation in the Soil

Percentage of Phosphorus Stored in Leaves
