

Note: Porous Surfaces like concrete, stucco, wood and tile may require a barrier applied to prevent the absorption of mineral oils from the PiGNX. If the product becomes hardened you know that it has been absorbed.

This is a fast and cost effective method of sealing the porous surfaces.

Tools you will need:

Tube of clear, Waterproof Bath and Tile Silicone

Putty Knife

Simply apply the Silicone in two beads as shown below and spread the product with the putty knife into a smooth layer. The silicone dries very quickly so the PiGNX can usually be applied by the time the silicone has been spread.

As you can see the Silicone is barely visible.
